Review: Arrays

if we want to do something to each element of the array, we need to use a loop!

Practice

- make an array that holds 1000 ints
- load the array with random ints from 0 to 600
- Output how many times the 589 occurs in the array

Lab

- Make 100 Rectangles
- dimension:
  - width = 50
  - height = 100
- place each at a random (x,y)
- fill each Rectangle with a random color

Lab Hints

- Instead of making an array of ints, make an array of Rectangles
- Use a while loop to fill the array
- For an array called *r*, the tenth Rectangle would be: r[9]
